

Discipline in the process of research

Prof. Kapila Abhayawansa

There is no doubt that the good piece of research is an outcome of the research work led by the good mental discipline. No one can make a good research with a confused mindset. From the very outset of the research one has to maintain the mental discipline throughout the research process up to the end of the conclusion of the research. Here Discipline means none other than keeping on the structure of the mind favorable to the different stages to the research process. In brief, it is the emotional management.

1. Understanding of what is research.

Most important thing is to readiness to accept the true meaning of the research. Research is not the mere explanation, clarification or description of something. In the true sense, research is a finding out the solution to a particular problem in a subject to which solution is not yet found.

2. Research topic

In the selection of topic you have to consider most appropriate topic out of the topics that come to you mind. Be careful to select a topic which does not refers to too broad field as well as too narrow field.

3. Data collection

Consider what most necessary data are. You have to be generous enough to give up irrelevant data. When you collect the data, they may be going against you hypothesis. Take only the data which can prove your hypothesis. Separate your data in accordance with your tentative chapters.

4. Body of the research

Here, First you have to arrange the tentative chapters according to your hypothesis in the way that what you say in the chapters lead logically to arrive at the conclusion.

5 Conclusion

This is not the summary of the chapters you written in your thesis. There you have to find out your final conclusion about you problem of the research. Show how you arrive at such a conclusion
